Research Interests
Leetmaa is the director of NOAA’s Geophysical Fluid Dynamics Laboratory, whose mission is the production of timely and reliable knowledge on natural climate variability and change, and in the development of the required earth system models. His own research interests in recent years have been on understanding the natural modes of climate variability and how they have contributed to recent climate; and on development of the capability to predict them, and to use this knowledge in practical seasonal forecasting. Other research interests include climate variability and change; understanding and prediction of natural climate variability; the role of the oceans in the climate system; understanding the interplay between economics, future climate, and impacts.

Areas of Expertise
Climate change, global climate system
